Hey genius, why didn't you just ask ChatGPT?

How much open-source do I even use? 🤔

The amount of open source code used in a web application can vary widely depending on the specific application and its requirements. However, it is common for web applications to make use of a significant amount of open source libraries and frameworks.

According to a report by Black Duck Software, which analyzed over 1,000 applications in 2016, the average web application included around 147 open source components, which accounted for approximately 70% of the application's codebase. This figure can vary based on the size and complexity of the application, as well as the specific libraries and frameworks used.

Using open source libraries and frameworks can significantly reduce development time and costs, as well as provide access to well-tested and high-quality code. However, it is important to properly manage and maintain these dependencies to ensure that they are up-to-date and secure.
